NAGPUR UNIVERSITY, NAAC ACCREDITED WITH 'A' GRADE)

Aim:

Café with Online Ordering: "Brew & Bean" café wants a site where users can build their coffee order. Use form elements (checkboxes for add-ons, number for quantity) and dynamically update the order summary and total price using JavaScript (conceptually, focus on the form UI

Objectives:

The main objective of the Brew & Bean Café Online Ordering System is to design a user-friendly web interface that allows customers to easily build and customize their coffee orders. The system aims to use HTML form elements such as dropdowns, checkboxes, and number inputs to collect user selections, and JavaScript to dynamically update the order summary and calculate the total price in real-time.

This project helps users understand how an interactive online ordering page works by showing how customer choices (coffee type, quantity, and add-ons) can be processed instantly on the same page without reloading.

Theory:

The Brew & Bean Café Online Ordering System is a web-based interface designed to allow users to select, customize, and review their coffee orders in a simple and interactive manner. The system uses a combination of HTML, CSS, and JavaScript to create a functional, real-time ordering experience similar to modern online food delivery platforms.

1. Use of HTML Form Elements

HTML forms provide the basic structure for taking input from users.

- A dropdown menu (select tag) is used to choose the type of coffee.
- Number input fields allow users to specify the quantity.
- Checkboxes are used for add-ons such as sugar, cream, chocolate syrup, etc.
- Buttons are used for submitting or clearing the order.

These elements make the interface interactive and easy to use.

2. Role of JavaScript

JavaScript is responsible for making the system dynamic. When the user selects any option, JavaScript immediately updates the:

- Order summary
- Total bill
- Selected add-ons
- Final quantity and price

This real-time calculation gives users immediate feedback without reloading the page, making the ordering process smooth and efficient.

3. UI Interaction Concept

The system follows a simple interaction cycle:

1. User selects the coffee type.
2. User customizes add-ons using checkboxes.
3. User sets the desired quantity.
4. JavaScript calculates the total amount.
5. The order summary updates on the screen automatically.

This concept teaches how Internet-based applications collect and process user inputs.

4. Importance of Client-Side Processing

The project demonstrates how client-side scripting (JavaScript) handles:

- Input validation
- Real-time computation
- Dynamic content updates (DOM manipulation)

This eliminates delays because no server communication is required for basic calculations.

5. Practical Significance

Such ordering systems are widely used in:

- Online cafés
- Food delivery apps
- Restaurant websites
- E-commerce product customizers

This project introduces the core idea of how real websites build and update cart items dynamically.

Conclusion:

The *Brew & Bean Online Ordering Website* demonstrates a simple yet effective model of a modern digital café platform. The project successfully presents a visually appealing menu, organized layout, and a smooth user experience using only HTML and CSS. Although it functions as a basic prototype, it establishes a strong foundation for developing a fully interactive and dynamic online ordering system in the future. With further enhancements such as real-time billing, database integration, and user authentication, this website can evolve into a complete and professional e-commerce solution for cafés and small businesses.
